## 1 Problem

Find the shortest distance between the lines

$$L_1: \mathbf{x} = \begin{pmatrix} 1 \\ 2 \\ 1 \end{pmatrix} + \lambda_1 \begin{pmatrix} 1 \\ -1 \\ 1 \end{pmatrix} \tag{1}$$

$$L_2 \colon \boldsymbol{x} = \begin{pmatrix} 2 \\ -1 \\ -1 \end{pmatrix} + \lambda_2 \begin{pmatrix} 2 \\ 1 \\ 2 \end{pmatrix} \tag{2}$$

#### 2 construction

When two lines are not intersecting the distance between them is non-zero. The equation of above mentioned lines in symmetric form is

$$L_1: x - 1 = 2 - y = z - 1$$
 (3)

$$L_2$$
:  $\frac{x-2}{2} = y + 1 = \frac{z+1}{2}$  (4)

The above line equations have no point of intersection as for no value of  $\lambda_1$ ,  $\lambda_2$  both the equations (3) and (4) are equal.

If the two line intersect then (3)=(4) i.e.

$$\begin{pmatrix} 1 \\ 2 \\ 1 \end{pmatrix} + \lambda_1 \begin{pmatrix} 1 \\ -1 \\ 1 \end{pmatrix} = \begin{pmatrix} 2 \\ -1 \\ -1 \end{pmatrix} + \lambda_2 \begin{pmatrix} 2 \\ 1 \\ 2 \end{pmatrix}$$
 (5)

$$\lambda_1 \begin{pmatrix} 1 \\ -1 \\ 1 \end{pmatrix} - \lambda_2 \begin{pmatrix} 2 \\ 1 \\ 2 \end{pmatrix} = \begin{pmatrix} 1 \\ -3 \\ -2 \end{pmatrix} \tag{6}$$

$$\begin{pmatrix} 1 & -2 \\ -1 & -1 \\ 1 & -2 \end{pmatrix} \begin{pmatrix} \lambda_1 \\ \lambda_2 \end{pmatrix} = \begin{pmatrix} 1 \\ -3 \\ -2 \end{pmatrix} \tag{7}$$

The Augmented matrix will be

$$\begin{pmatrix} 1 & -2 & 1 \\ -1 & -1 & -3 \\ 1 & -2 & -2 \end{pmatrix}$$
 (9)

$$\begin{pmatrix} 1 & -2 & 1 \\ -1 & -1 & -3 \\ 1 & -2 & -2 \end{pmatrix} \xrightarrow{R_1 = R_1 - R_2} \begin{pmatrix} 0 & 0 & 3 \\ -1 & -1 & -3 \\ 1 & -2 & -2 \end{pmatrix}$$
 (10)

The above matrix has a rank = 3. Hence the lines do not intersect

### 3 SOLUTION

Let A be a point on line  $L_1$  and B be point on the line  $L_2$ . Then the shortest distance between two skew lines will be the length of line perpendicular to both the lines  $L_1, L_2$  and passing through A and B.

The vector passing through  $\boldsymbol{A}$  and  $\boldsymbol{B}$  will be

$$\mathbf{A} - \mathbf{B} = \mathbf{x_1} - \mathbf{x_2} + \begin{pmatrix} \mathbf{m_1} & -\mathbf{m_2} \end{pmatrix} \begin{pmatrix} \lambda_1 \\ \lambda_2 \end{pmatrix}$$
 (11)

The vectors  $m_1, m_2$  are both perpendicular to the line AB. So the dot product of  $m_1, m_2$  with the line AB is zero.

The dot product of  $m_1$  with the line AB is

$$\mathbf{m}_{1}^{T}(\mathbf{A} - \mathbf{B}) = 0$$

$$\mathbf{m}_{1}^{T}(\mathbf{x}_{1} - \mathbf{x}_{2}) + \mathbf{m}_{1}^{T}(\mathbf{m}_{1} - \mathbf{m}_{2}) \begin{pmatrix} \lambda_{1} \\ \lambda_{2} \end{pmatrix} = 0$$
 (12)

The dot product of  $m_2$  with the line AB is

$$m_2^T (A - B) = 0$$
  
 $m_1^T (x_1 - x_2) + m_2^T (m_1 - m_2) \binom{\lambda_1}{\lambda_2} = 0$  (13)

Let the matrix M be

$$\boldsymbol{M} = \begin{pmatrix} \boldsymbol{m}_1^T \\ \boldsymbol{m}_2^T \end{pmatrix} \tag{14}$$

Combining the equations (12) and (13) in matrix form, using equation (14), we get

$$\boldsymbol{M}\boldsymbol{M}^{T} \begin{pmatrix} \lambda_{1} \\ -\lambda_{2} \end{pmatrix} + \boldsymbol{M}(\boldsymbol{x}_{1} - \boldsymbol{x}_{2}) = 0$$
 (15)

simplifying it further

$$\boldsymbol{M}\boldsymbol{M}^{T} \begin{pmatrix} \lambda_{1} \\ -\lambda_{2} \end{pmatrix} = \boldsymbol{M}(\boldsymbol{x}_{2} - \boldsymbol{x}_{1}) \tag{16}$$

To find the points on the lines which make up the shortest distance we need to find  $\lambda_1$  and  $\lambda_2$  using the above expression to get the augmented form

$$\begin{pmatrix} m_1^T m_1 & m_1^T m_2 \\ m_2^T m_1 & m_2^T m_2 \end{pmatrix} \begin{pmatrix} \lambda_1 \\ -\lambda_2 \end{pmatrix} = \begin{pmatrix} m_1^T (x_2 - x_1) \\ m_2^T (x_2 - x_1) \end{pmatrix}$$
(17)
$$\begin{pmatrix} m_1^T m_1 & m_1^T m_2 & m_1^T (x_2 - x_1) \\ m_2^T m_1 & m_2^T m_2 & m_2^T (x_2 - x_1) \end{pmatrix}$$
(18)

we know that

$$\mathbf{x_1} = \begin{pmatrix} 1 \\ 2 \\ 1 \end{pmatrix}, \mathbf{x_2} = \begin{pmatrix} 2 \\ -1 \\ -1 \end{pmatrix}, \mathbf{m_1} = \begin{pmatrix} 1 \\ -1 \\ 1 \end{pmatrix} and \mathbf{m_2} = \begin{pmatrix} 2 \\ 1 \\ 2 \end{pmatrix}$$

so the augmented matrix will be

$$\begin{pmatrix} 3 & 3 & 2 \\ 3 & 9 & -5 \end{pmatrix}$$
 (20)

Using row reduction  $R_2 = R_2 - R_1$ , we get

$$\begin{pmatrix} 3 & 3 & 2 \\ 0 & 6 & -7 \end{pmatrix} (21)$$

So the values of  $\lambda_1 = \frac{11}{6}$  and  $\lambda_2 = \frac{7}{6}$ 

Using the equation (1) and (2), we get the points as  $\frac{1}{6} \begin{pmatrix} 17\\1\\17 \end{pmatrix}$  and  $\frac{1}{6} \begin{pmatrix} 26\\1\\8 \end{pmatrix}$  on the line  $L_1, L_2$  respectively.

The shortest distance between the lines is the

absolute value of projection of the vector AB on to the unit vector n.

$$\|(\mathbf{B} - \mathbf{A})\| = \|\frac{1}{6} {1 \choose 17} - \frac{1}{6} {26 \choose 1} \| = \frac{3}{\sqrt{2}}$$
 (22)

Therefore the shortest distance between the given lines is  $\frac{3}{\sqrt{2}}$ 

The unit vector perpendicular to lines

$$Line_1: \mathbf{x} = \mathbf{x_1} + \lambda_1 \mathbf{m_1} \tag{23}$$

$$Line_2: \mathbf{x} = \mathbf{x_2} + \lambda_1 \mathbf{m_2} \tag{24}$$

can be found by

$$\frac{A - B}{\|A - B\|}$$

$$\frac{\frac{1}{6} \begin{pmatrix} 17\\1\\17 \end{pmatrix} - \frac{1}{12} \begin{pmatrix} 26\\1\\8 \end{pmatrix}}{\|\frac{1}{6} \begin{pmatrix} 17\\1\\17 \end{pmatrix} - \frac{1}{12} \begin{pmatrix} 26\\1\\8 \end{pmatrix}\|}$$

So the unit vector perpendicular to both  $L_1$  and  $L_2$  is

$$n = \frac{1}{\sqrt{2}} \begin{pmatrix} -1\\0\\1 \end{pmatrix} \tag{26}$$
